CS 33

Virtual Memory (2)

Mapped Files

Traditional File I/O

```
char buf[BigEnough];
fd = open(file, O_RDWR);
for (i=0; i<n_recs; i++) {
    read(fd, buf, sizeof(buf));
    use(buf);
}</pre>
```

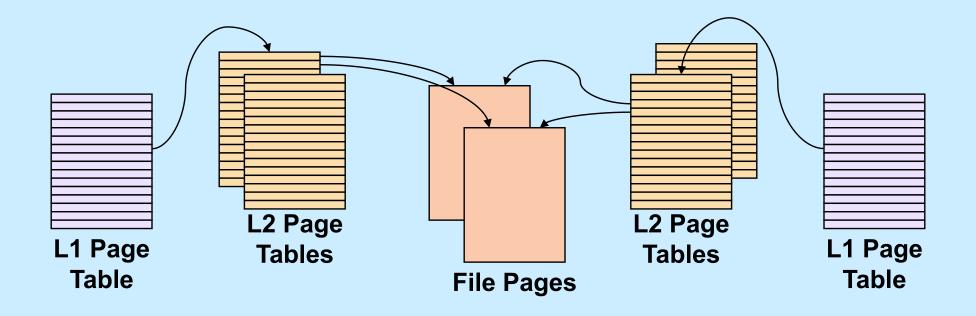

Mapped File I/O

```
record_t *MappedFile;
fd = open(file, O_RDWR);
MappedFile = mmap(..., fd, ...);
for (i=0; i<n_recs; i++)
   use(MappedFile[i]);</pre>
```

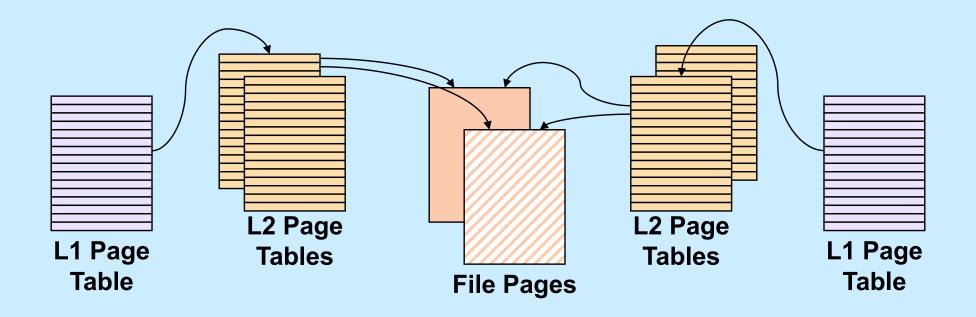

Mmap System Call

```
void *mmap(
  void *addr,
    // where to map file (0 if don't care)
  size t len,
    // how much to map
  int prot,
    // memory protection (read, write, exec.)
  int flags,
    // shared vs. private, plus more
  int fd,
    // which file
  off t off
    // starting from where
  );
```

The mmap System Call

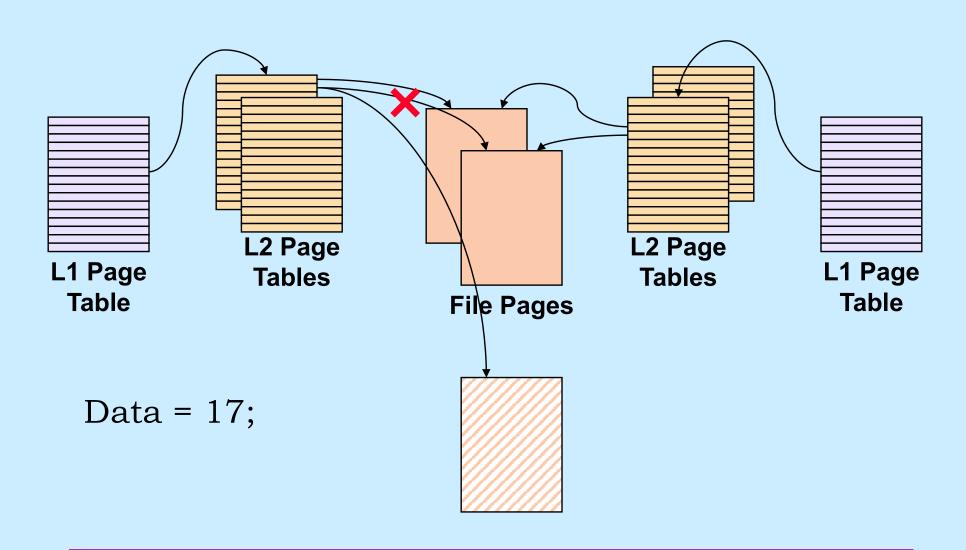

Share-Mapped Files

Data =
$$17$$
;

Private-Mapped Files

Example

```
int main() {
  int fd;
  dataObject t *dataObjectp;
  fd = open("file", O RDWR);
  if ((int) (dataObjectp = (dataObject_t *) mmap(0,
      sizeof(dataObject t),
      PROT READ | PROT WRITE, MAP SHARED, fd, 0) == -1) {
    perror("mmap");
    exit(1);
  // dataObjectp points to region of (virtual) memory
  // containing the contents of the file
```

fork and mmap

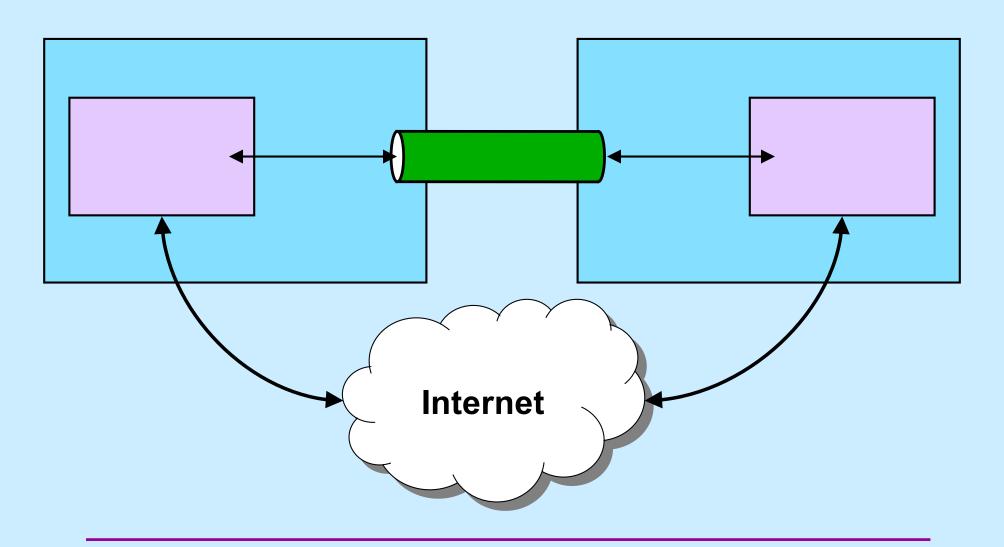

```
int main() {
  int x=1;
  if (fork() == 0) {
   // in child
   x = 2;
   exit(0);
  // in parent
 while (x==1)
   // will loop forever
 return 0;
```

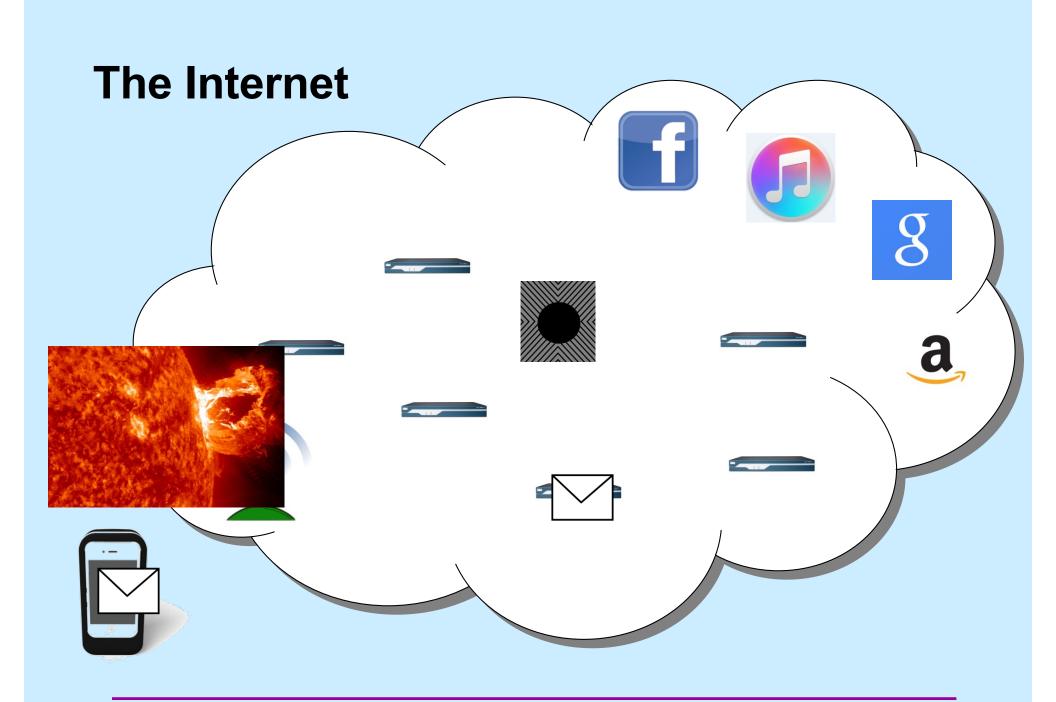

```
int main() {
  int fd = open( ... );
  int *xp = (int *) mmap(...,
      MAP SHARED, fd, ...);
 xp[0] = 1;
  if (fork() == 0) {
    // in child
   xp[0] = 2;
   exit(0);
 // in parent
 while (xp[0] == 1) {
    // will terminate
  return 0;
```

CS 33

Network Programming (1)

Communicating Over the Internet

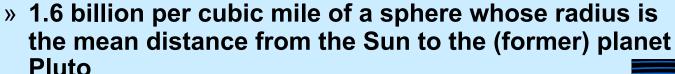

Names and Addresses

- cslab1c.cs.brown.edu
 - the name of a computer on the internet
 - mapped to an internet address
- nytimes.com
 - the name of a website
 - mapped to a number of internet addresses
- How are names mapped to addresses?
 - domain name service (DNS): a distributed database
- How are the machines corresponding to internet addresses found?
 - with the aid of various routing protocols

Internet Addresses

- IP (internet protocol) address
 - one per network interface
 - 32 bits (IPv4)
 - » 5527 per acre of RI
 - » 25 per acre of Texas
 - 128 bits (IPv6)

- one per service instance per machine
- 16 bits
 - » port numbers less than 1024 are reserved for privileged applications

Notation

- Addresses (assume IPv4: 32-bit addresses)
 - written using dot notation
 - » 128.48.37.1
 - dots separate bytes
 - address plus port (1426):
 - » 128.48.37.1:1426

Reliability

- Two possibilities
 - don't worry about it
 - » just send it
 - if it arrives at its destination, that's good!
 - no verification
 - worry about it
 - » keep track of what's been successfully communicated
 - receiver "acks"
 - » retransmit until
 - · data is received

or

it appears that "the network is down"

Reliability vs. Unreliability

- Reliable communication
 - good for
 - » email
 - » texting
 - » distributed file systems
 - » web pages
 - bad for
 - » streaming audio
 - » streaming video

a little noise is better than a long pause

The Data Abstraction

- Byte stream
 - sequence of bytes
 - » as in pipes
 - any notion of a larger data aggregate is the responsibility of the programmer
- Discrete records
 - sequence of variable-size "records"
 - boundaries between records maintained
 - receiver receives discrete records, as sent by sender

What's Supported

- Stream
 - byte-stream data abstraction
 - reliable transmission
- Datagram
 - discrete-record data abstraction
 - unreliable transmission

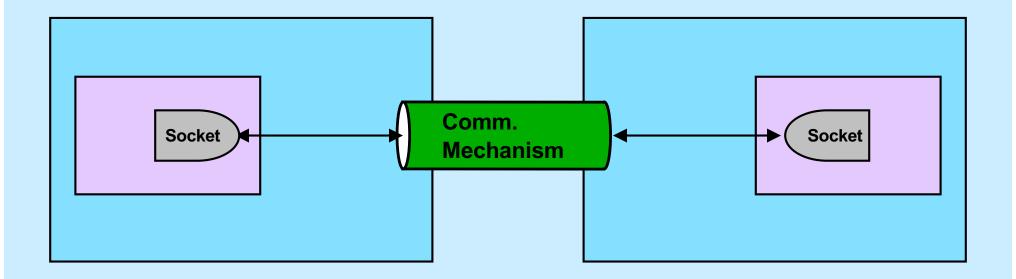

Quiz 1

The following code is used to transmit data over a reliable byte-stream communication channel. Assume sizeof(data) is large.

Does it work?

- a) always
- b) always, assuming no network problems
- c) sometimes
- d) never

Sockets

- You tell the system what you want by setting up the socket
- The system deals with all the other details

Socket Parameters

- Styles of communication:
 - stream: reliable, two-way byte streams
 - datagram: unreliable, two-way record-oriented
 - and others
- Communication domains
 - UNIX
 - » endpoints (sockets) named with file-system pathnames
 - » supports stream and datagram
 - » trivial protocols: strictly for intra-machine use
 - Internet
 - » endpoints named with IP addresses
 - » supports stream and datagram
 - others
- Protocols
 - the means for communicating data
 - e.g., TCP/IP, UDP/IP

Setting Things Up

- Socket (communication endpoint) is set up
- Datagram communication
 - use sendto system call to send data to named recipient
 - use recvfrom system call to receive data and name of sender
- Stream communication
 - client connects to server
 - » server uses listen and accept system calls to receive connections
 - » client uses connect system call to make connections
 - data transmitted using send or write system calls
 - data received using recv or read system calls

Socket Addresses

- struct sockaddr
 - represents a network address
 - many sorts
 - » we use struct sockaddr_in
 - we can ignore the details
 - » embedded in layers of software
- getaddrinfo()
 - function used to obtain struct sockaddr's

getaddrinfo()

- node is the host you want to look up (NULL for the machine you are on)
- service is the service on that host (may be supplied as a port number)
- hints are additional information describing what you want
- res is a list of struct sockaddr containing the results of the search

UDP Server (1)

```
int main(int argc, char *argv[]) {
   if (argc != 2) {
      fprintf(stderr, "Usage: server port\n");
      exit(1);
   }
   int udp_socket;
   struct addrinfo udp_hints;
   struct addrinfo *result;
```

UDP Server (2)

UDP Server (3)

```
struct addrinfo *r;
for (r = result; r != NULL; r = r->ai next) {
    if ((udp socket =
          socket(r->ai family, r->ai socktype,
          r->ai protocol)) < 0) {
        continue;
    if (bind(udp socket, r->ai addr, r->ai addrlen) >= 0) {
        break;
    close(udp socket);
```

UDP Server (4)

```
if (r == NULL) {
    fprintf(stderr, "Could not bind to %s\n", argv[1]);
    exit(1);
}
freeaddrinfo(result);
```

UDP Server (5)

```
while (1) {
    char buf[1024];
    struct sockaddr from_addr;
    int from_len = sizeof(struct sockaddr);
    int msg size;
```

UDP Server (6)

UDP Server (7)

UDP Server (8)

UDP Client (1)

```
int main(int argc, char *argv[]) {
    int s;
    int sock;
    struct addrinfo hints;
    struct addrinfo *result;
    struct addrinfo *rp;

if (argc != 3) {
        fprintf(stderr, "Usage: client host port\n");
        exit(1);
    }
}
```

UDP Client (2)

UDP Client (3)

```
// Step 2: set up socket for UDP
for (rp = result; rp != NULL; rp - rp->ai next) {
    if ((sock = socket(rp->ai family, rp->ai_socktype,
          rp->ai protocol)) >= 0) {
       break:
if (rp == NULL) {
    fprintf(stderr, "Could not communicate with %s\n",
          argv[1]);
    exit(1);
freeaddrinfo(result);
```

UDP Client (4)

```
// Step 3: communicate with server
communicate(sock, rp);
return 0;
```

UDP Client (5)

```
int communicate(int fd, struct addrinfo *rp) {
    while (1) {
        char buf[1024];
        int msg_size;

    if (fgets(buf, 1024, stdin) == 0)
        break;
```

UDP Client (6)

UDP Client (7)

```
/* receive response from server */
if ((msg_size = recvfrom(fd, buf, 1024, 0, 0, 0)) < 0) {
    perror("recvfrom");
    exit(1);
}
buf[msg_size] = 0;
printf("Server says: %s\n", buf);
}
return 0;</pre>
```

Quiz 2

Suppose a process on one machine sends a datagram to a process on another machine. The sender uses *sendto* and the receiver uses *recvfrom*. There's a momentary problem with the network and the datagram doesn't make it to the receiving process. Its call to *recvfrom*

- a) returns -1 (indicating an error)
- b) returns 0
- c) returns some other value
- d) doesn't return

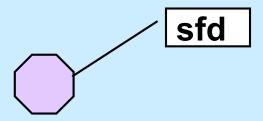

Reliable Communication

- The promise ...
 - what is sent is received
 - order is preserved
- Set-up is required
 - two parties agree to communicate
 - within the implementation of the protocol:
 - » each side keeps track of what is sent, what is received
 - » received data is acknowledged
 - » unack'd data is re-sent
- The standard scenario
 - server receives connection requests
 - client makes connection requests

Streams in the Inet Domain (1)

- Server steps
 - 1) create socket

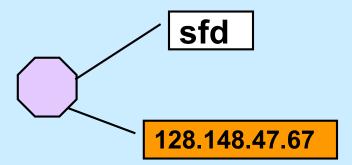

```
sfd = socket(AF INET, SOCK STREAM, 0);
```

Streams in the Inet Domain (2)

- Server steps
 - 2) bind name to socket

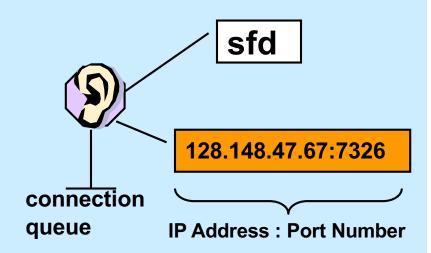

```
bind(sfd,
  (struct sockaddr *) &my_addr, sizeof(my_addr));
```

Streams in the Inet Domain (3)

- Server steps
 - 3) put socket in "listening mode"

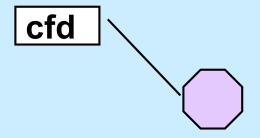

```
int listen(int sfd, int MaxQueueLength);
```

Streams in the Inet Domain (4)

- Client steps
 - 1) create socket

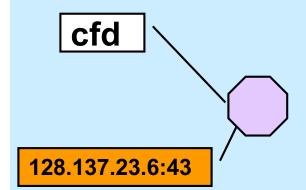

```
cfd = socket(AF INET, SOCK STREAM, 0);
```

Streams in the Inet Domain (5)

- Client steps
 - 2) bind name to socket

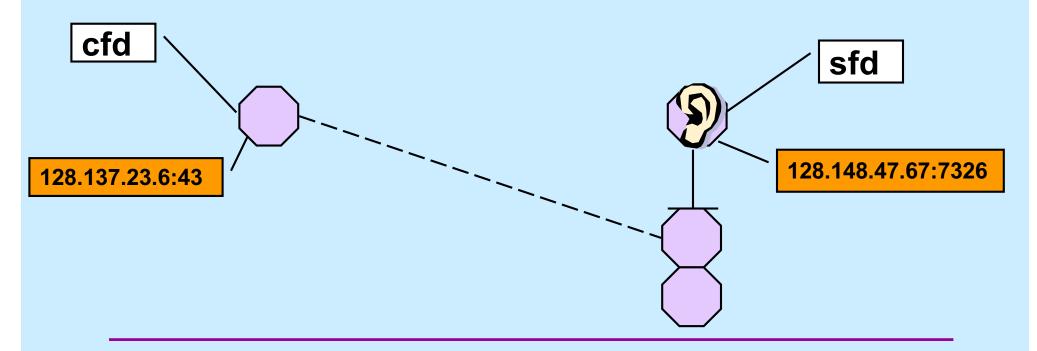

```
bind(cfd,
  (struct sockaddr *)&my_addr, sizeof(my_addr));
```

Streams in the Inet Domain (6)

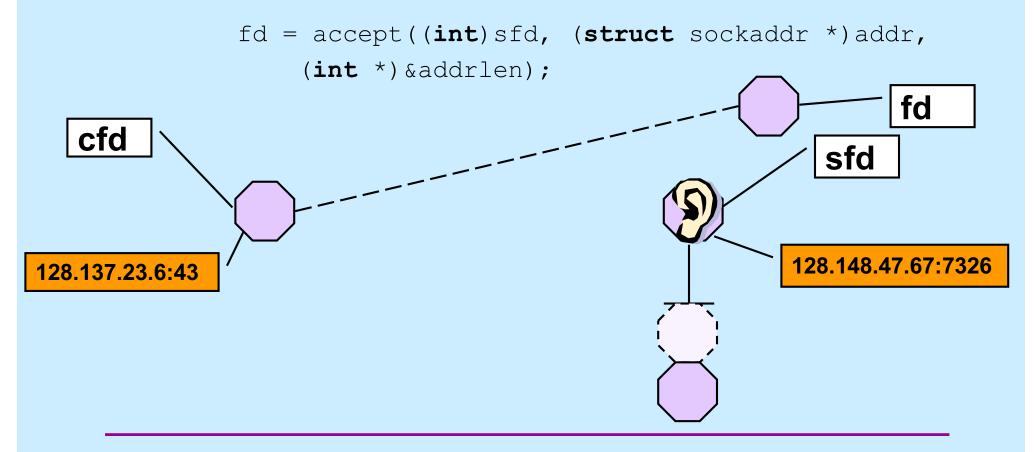

- Client steps
 - 3) connect to server

```
connect(cfd, (struct sockaddr *)&server_addr,
    sizeof(server addr));
```

Streams in the Inet Domain (7)

- Server steps
 - 4) accept connection

TCP Server (1)

```
int main(int argc, char *argv[]) {
   if (argc != 2) {
      fprintf(stderr, "Usage: port\n");
      exit(1);
   }

int lsocket;
   struct addrinfo tcp_hints;
   struct addrinfo *result;
```

TCP Server (2)

```
memset(&tcp_hints, 0, sizeof(tcp_hints));
tcp_hints.ai_family = AF_INET;
tcp_hints.ai_socktype = SOCK_STREAM;
tcp_hints.ai_flags = AI_PASSIVE;

int err;
if ((err = getaddrinfo(NULL, argv[1], &tcp_hints, &result)) != 0) {
   fprintf(stderr, "%s\n", gai_strerror(err));
   exit(1);
}
```

TCP Server (3)

```
struct addrinfo *r;
for (r = result; r != NULL; r = r->ai next) {
    if ((lsocket =
          socket(r->ai family, r->ai socktype,
          r->ai protocol)) < 0) {
        continue;
    if (bind(lsocket, r->ai addr, r->ai addrlen) >= 0) {
        break;
    close(lsocket);
```

TCP Server (4)

```
if (r == NULL) {
    fprintf(stderr, "Could not find local interface %s\n");
    exit(1);
}
freeaddrinfo(result);

if (listen(lsocket, 5) < 0) {
    perror("listen");
    exit(1);
}</pre>
```

TCP Server (5)

```
while (1) {
   int csock;
   struct sockaddr client_addr;
   int client_len = sizeof(client_addr);

   csock = accept(lsocket, &client_addr, &client_len);
   if (csock == -1) {
      perror("accept");
      exit(1);
   }
```

TCP Server (6)

TCP Server (7)

```
switch (fork()) {
    case -1:
        perror("fork");
        exit(1);
    case 0:
        serve(csock);
        exit(0);
    default:
        close(csock);
        break;
return 0;
```

TCP Server (8)

```
void serve(int fd) {
    char buf[1024];
    int count;
    while ((count = read(fd, buf, 1024)) > 0) {
        write(1, buf, count);
    if (count == -1) {
        perror("read");
        exit(1);
    printf("connection terminated\n");
```

TCP Client (1)

```
int main(int argc, char *argv[]) {
    int s;
    int sock;
    struct addrinfo hints;
    struct addrinfo *result;
    struct addrinfo *rp;
    char buf[1024];
    if (argc != 3) {
        fprintf(stderr, "Usage: tcpClient host port\n");
        exit(1);
```

TCP Client (2)

```
memset(&hints, 0, sizeof(hints));
hints.ai_family = AF_INET;
hints.ai_socktype = SOCK_STREAM;

if ((s=getaddrinfo(argv[1], argv[2], &hints, &result))
    != 0) {
    fprintf(stderr, "getaddrinfo: %s\n", gai_strerror(s));
    exit(1);
}
```

TCP Client (3)

TCP Client (4)

```
if (rp == NULL) {
    fprintf(stderr, "Could not connect to %s\n", argv[1]);
    exit(1);
}
freeaddrinfo(result);
```

TCP Client (5)

```
while(fgets(buf, 1024, stdin) != 0) {
    if (write(sock, buf, strlen(buf)) < 0) {
        perror("write");
        exit(1);
    }
}
return 0;</pre>
```

Quiz 3

The previous slide contains

write(sock, buf, strlen(buf))

If data is lost and must be retransmitted

- a) write returns an error so the caller can retransmit the data.
- b) nothing happens as far as the application code is concerned, the data is retransmitted automatically.

Quiz 4

A previous slide contains

write(sock, buf, strlen(buf))

We lose the connection to the other party (perhaps a network cable is cut).

- a) write returns an error so the caller can reconnect, if desired.
- b) nothing happens as far as the application code is concerned, the connection is reestablished automatically.
